My understanding of the role

Help turn lawyers’ reasoning into reusable rules, drafts and review checks.

1 **Learn the decisions**

Ask when a paragraph applies—and what exceptions stop it.

2 **Make the instructions explicit**

Record the facts, conditions, dependencies and source links.

3 **Check the result with the team**

Explain selections and test changes before wider use.

THE BOUNDARY

Lawyers approve the reasoning.

Rules assemble the draft.

AI can suggest review points.

The engineer makes the approved process clear and testable; the lawyer decides legal applicability.

Basis: original internship posting supplied by the candidate. Proposed understanding, not an internal-system assessment.

PREVIOUS EXPERIENCE

My earlier work in legal question answering

North South University · Bangladeshi statutes · early research contribution

1 **Review the problem**

Explore unreliable answers and confusion between legal sources.

2 **Organise the legal sources**

Keep statutory sections together and retain their Act names.

3 **Move to LLM inference work**

Another sub-team continued the legal research.

THE CONNECTION TO THIS DEMO

Earlier question:

“Where did this legal passage come from?”

Recent prototype:

“When should this paragraph be used?”

UkilRAG is a recent demonstration of my understanding of the internship requirements.

Earlier responsibilities based on candidate account. The recent prototype is separate from the published implementation.

Prepare the legal sources and paragraph rules

These cells define the ingredients. They do not write the draft yet.

1 **Label the legal sources**

Keep its ID, Act, section, summary and recorded update note.

2 **Define each paragraph’s rules**

Record when to include it, what must come first and what conflicts.

3 **Link the paragraph to its sources**

The same source ID connects the two records.

SMALL EXAMPLE

Source: C167
Criminal Procedure, section 167

Records paragraph (M5):
Needs records AND selected M3.
Must cite C167.

Output: a source table and a versioned list of paragraphs with their rules.

Notebook cells 1–2: 10 educational source summaries; 7 modules; fictional judgment updates and teaching rules.

Use the facts to build and explain the draft

The same facts and rule version produce the same prepared output.

1 Check the facts and conditions

Reject invalid values; check facts and required earlier blocks.

2 Reject conflicting choices

Stop if two configured exclusive routes were selected.

3 Assemble prepared paragraphs

Fill in case details and record why every block was used or skipped.

SAMPLE OUTPUT

Jurisdiction → Facts → Procedure
→ Records → Relief

Decision record:
M5 INCLUDED: records exist
and M3 was selected.

The output is a document plus a trace: the program shows its working.

Notebook cell 3: actual selected sequence for fictional SAMPLE_CASE; no generative model assembles this draft.

Search for sources and flag what needs review

Text search and citation checks are separate; neither decides the legal strategy.

1 Search the source summaries

Try the whole query; if no match passes, split explicit parts and retry.

2 Check the draft’s references

Flag required markers that are missing, unknown or unlinked.

3 Check recorded judgment notes

Flag selected paragraphs linked to notes newer than the rule snapshot.

ACTUAL SAMPLE REPORT

3 update warnings:

M3 → C54 and C167

M5 → C167

No missing-citation warnings.

Case summary: no accepted sources.

A warning means “please review this”—not “this argument is definitely wrong.”

Notebook cell 4: saved sample output. Notes are simulated; source applicability requires professional assessment.

Test whether changes break expected behaviour

Use fixed examples with written expectations, then report PASS or FAIL.

1 Repeat the same case

Run it 25 times and compare the document and full-result fingerprints.

2 Check four cases and conflicts

Check four expected module/citation lists; request both exclusive routes.

3 Add a simulated source update

Check the correct paragraphs receive warnings after the change.

RESULTS

Repeatability: PASS

Four reference cases: PASS

Conflict guard: PASS

Update warning check: PASS

Extra checks cover citations and search.

Passing shows expected software behaviour on these examples—not universal legal accuracy.

Notebook cell 5: four test groups passed; fixtures are synthetic, not genuinely lawyer-approved historical files.

How I would keep it reliable in real use

Develop one narrow workflow with the team before expanding the system.

1 Start with approved material

Use verified full sources, agreed rules and authorised example cases.

2 Review each change

Save versions, rerun examples and explain intended and unexpected differences.

3 Evaluate the weak points

Evaluate retrieval and citation support; keep ambiguous findings with reviewers.

FIRST PILOT

One workflow

One agreed reference set

A small implementation

A review with lawyers and engineers

Then decide what to improve.

Which workflow would be the most useful starting point for this internship?

Proposed improvements based on the brief and demo limitations, not verified shortcomings in the existing company system.
